| Team ID       | SWTID-2026-9203                                |
| Project Name  | Import Data using Transform Maps (Spreadsheet) |
| Maximum Marks | 4 Marks                                        |

Scenario: Importing, transforming, and validating employee data received in spreadsheet format.

| Journey Stage | Steps                        | Interactions                                                                           | Goals & Motivations                                                             | Positive Moments                                                 | Negative Moments                                                                 | Areas of Opportunity                                                                            |
|---------------|------------------------------|----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Entice        | Receive employee spreadsheet | Administrator receives or accesses the Excel file containing structured employee data. | Help me understand what data I need to import and avoid incomplete source data. | Structured spreadsheet makes bulk migration possible.            | Unclear columns, missing values or inconsistent formats may require preparation. | Define a standard spreadsheet format and required columns before loading.                       |
| Enter         | Open Import Set / load data  | Administrator selects the spreadsheet and loads it into an Import Set table.           | Help me load the complete file into ServiceNow without manual record entry.     | Import Set provides a staging area for bulk data.                | Incorrect file or source structure can cause load issues.                        | Provide a simple source-file checklist and verify column headers before loading.                |
| Engage        | Review staged source data    | Administrator reviews the Import Set rows and source fields.                           | Help me confirm that the staged data is complete before transformation.         | Staging separates source data from the target records.           | Invalid or unexpected values may be noticed late.                                | Validate required fields and source formats before transformation.                              |
| Engage        | Configure Transform Map      | Administrator maps source fields to corresponding target table fields.                 | Help me move each spreadsheet value into the correct ServiceNow field.          | Clear source-to-target mapping makes transformation repeatable.  | Wrong mapping can create inaccurate target records.                              | Use explicit field mapping and, where applicable, a unique matching field to reduce duplicates. |
| Engage        | Run transformation           | Administrator executes the Transform Map.                                              | Help me transform all valid rows efficiently.                                   | Bulk transformation reduces manual entry.                        | Transform errors can prevent some rows from being created or updated.            | Review transformation status and error information after execution.                             |
| Exit          | Verify target records        | Administrator checks records created in the employee target table.                     | Help me confirm that imported records are accurate and complete.                | Successful records can be verified directly in the target table. | Missing or incorrect records require correction and reprocessing.                | Use a verification checklist comparing source and target fields.                                |
| Extend        | Reuse the import process     | Administrator can repeat the workflow for future employee spreadsheets.                | Help me perform future bulk imports consistently.                               | A defined Import Set + Transform Map workflow is reusable.       | Changes to spreadsheet structure may require remapping.                          | Maintain a standard source template and document the mapping rules.                             |

Note: This journey map follows the supplied template's stages—Entice, Enter, Engage, Exit and Extend—and focuses them on the spreadsheet-to-ServiceNow import experience.

# Importing, transforming, and validating employee data

Scenario: Importing, transforming, and validating employee data received in spreadsheet format.

From Spreadsheet  
to ServiceNow  
Accurate data. Better workflows.
