

Project Design Phase

Proposed Solution

Date	01 October 2026
Team ID	SWTID-2026-9203
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

The supplied template requires six parameters: Problem Statement, Idea/Solution description, Novelty/Uniqueness, Social Impact/Customer Satisfaction, Business Model (Revenue Model), and Scalability of the Solution.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Organizations may receive employee data in spreadsheet form that must be migrated into ServiceNow. Manual entry is repetitive and can introduce data-entry and field-mapping errors, making bulk migration slower and harder to verify.
2	Idea / Solution description	Use ServiceNow Import Sets as a staging area for the spreadsheet. Configure a Transform Map to map each source field to the appropriate target field, execute the transformation, and verify the resulting employee records and transformation results.
3	Novelty / Uniqueness	The project combines standard ServiceNow Import Set and Transform Map capabilities into a clearly defined end-to-end workflow for beginner-level employee-data migration. Its value is the structured staging → mapping → transformation → verification flow rather than a new algorithm.
4	Social Impact / Customer Satisfaction	Reduces repetitive manual data entry for administrators, improves consistency of employee records, and gives users a clearer way to verify imported data. This can improve administrator confidence and reduce avoidable rework.
5	Business Model (Revenue Model)	For an internal organizational implementation, the solution is primarily a productivity and process-improvement capability rather than a standalone revenue product. Value is obtained through reduced manual effort, lower rework and more efficient data migration. If packaged as a ServiceNow implementation service, it can be delivered as part of configuration, training or consulting work.

6	Scalability of the Solution	The workflow can be reused for larger employee-data batches and repeated imports with the same spreadsheet structure. It can also be adapted to other structured data-migration use cases by changing the Import Set, target table and field mappings.
---	-----------------------------	--

Proposed Outcome: A repeatable ServiceNow spreadsheet-import workflow that moves employee data from source file to target records while preserving a clear mapping and verification path.
